NURS 498VH: NURS Honors Thesis Project

Dr. Peggy Lee

April 28, 2021

Introduction

The nursing workforce today is made up of a multitude of different generations of nurse. Most recently, the millennial generation has entered the nursing workforce, bringing with them a wide variety of new perceptions that will transform future health care. Millennial generation nurses, born between 1980 and 2000, differ greatly from nurses who identify as Baby Boomers, born between 1946 and 1964, and nurses who identify as Generation X, born between 1965 and 1979 (Waltz, Muñoz, Weber Johnson, and Rodriguez, 2020). Millennial generation nurses are more likely to express their opinions about the work environment, as well as communicate their desire to obtain satisfaction and engagement in the workplace. Furthermore, there are noted differences in the workforce between Generation X and Baby Boomers patterns of communication and engagement of the Millennials in the workplace. In the approaching future, Millennial nurses will find it necessary to know how to navigate the nursing profession as the Baby Boomer and Generation X nurses begin to phase out of the workforce. Healthcare will evolve with changes in the transmission of patient care and information dissemination as the Millennials enter the workforce. This literature review will discuss the implications of the advent of the Millennial generation into the nursing workforce and how the changes will impact nursing as a career for the foreseeable future. Further research should be conducted to identify and discuss the variety in the Millennial generation's viewpoints based on age, work specialty area, life experiences.

Methods

Foreground Research Question

In the United States, are nurses who identify as members of the Millennial generation more likely to find job satisfaction and engagement in the workplace than nurses who identify as members of previous generations (Baby Boomers or Generation X)?

Information Sources

A current review of available research was conducted that identified the Millennial generation and their viewpoint toward job satisfaction and work engagement. The review compared job satisfaction and work engagement in the Millennial generation nurses and job satisfaction and work engagement in nurses who fall into the Baby Boomer generation or Generation X. For this review, PubMed, CINAHL Complete, and Google Scholar databases were utilized to research and identify 15 sources for evaluation.

Search Strategy

With regard to the foreground research questions, the search terms used within the PubMed database, were comprised of “*millennial generation nurses*”. Within the CINAHL Complete database, the following search terms were utilized, “*millennials*” and “*nurses*” and “*job satisfaction*”. Within the Google Scholar database, the search terms used were “*millennial nurses*” and “*workplace engagement*”. In order to reduce nonspecific search results, further search limiters were employed, which included *2010-2020-time restriction*, *Full-text articles*, and *Peer-reviewed journal articles*. Additionally, the *Human subject* search limiter was employed within the Google Scholar database.

Inclusion Criteria and Exclusion Criteria

Following the initial article search, a review of selected articles was completed while being checked against inclusion and exclusion criteria on all three databases (CINAHL Complete, PubMed, and Google Scholar). Duplicate articles from all three databases were extracted and increased limitations were added to reduce continued extraneous results. Articles were discarded if they did not meet the criteria set forth. During the search strategy, articles were reviewed based on inclusion and exclusion criteria. To determine utilization of articles, eligibility was determined based from PICO components of the foreground research question. Articles were not included if the study did not discuss Millennial generation nurses in the U.S., job satisfaction, workplace engagement, or focus on nursing students rather than licensed nurses.

Data Extraction

After the search strategy was completed, a list was compiled of fifteen total articles that met the selected criteria. Pertinent information from all fifteen articles was collected independently by the main investigator (Clonch) and was cross-referenced by the same investigator for discrepancies and validity later. Data retrieved for evaluation by the main investigator was comprised of location of study, the study purpose, the specified time frame of the study conduction, the measurements of job satisfaction and work engagement, and the population discussed in the study. Of the 15 articles reviewed, 9 discussed job satisfaction and 6 discussed work engagement. There were multiple articles that discussed job satisfaction and work engagement and how they relate to Millennial generation nurses. Waltz, Muñoz, Weber Johnson, and Rodriguez (2020, p.673) state “Millennials are significantly less satisfied in their jobs compared with nurses of other generations”. However, Broom (2010, p.50) indicates that a “flat, organizational structure,

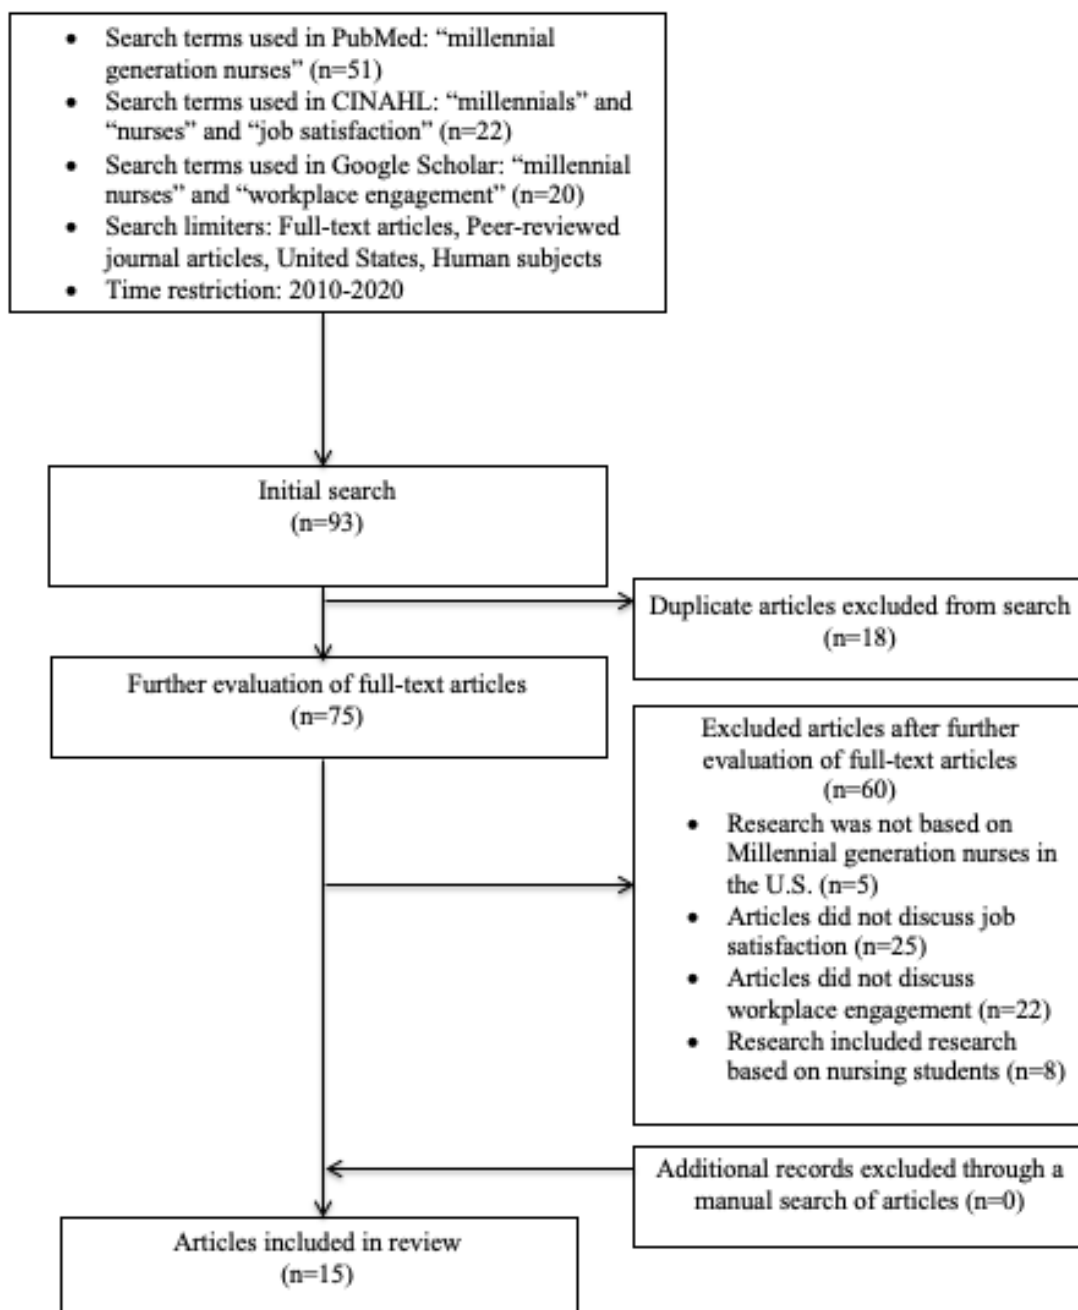

visionary and engaging leadership, participative management, and availability of adequate resources to support nursing care.” The conclusion in an additional study considers “the prominence of RN’s sociological value systems on their perceptions of the workplace”, therefore recommending nurse managers to “work to create an environment that is supportive of multiple generations; an environment that enhances psychological empowerment, and, in turn, job satisfaction” (Coburn and Hall, 2014). Dols, Chargualaf, and Martinez (2019, p.201) discuss the idea that “intergenerational differences related to communication, teamwork, and comfort using health information technology contribute to work-related stress and influence job satisfaction”. Gordon (2017) examines the idea of autonomy, respect, and feeling valued contributing to job satisfaction. Additionally, Mancuso (2020) suggests that nursing job satisfaction, specifically for Millennials, is directly correlated to retention rates. Moreover, O’Hara, Burke, Ditomassi, and Palan Lopez (2019) agree with the previous statement, in that they imply their study found “supportive leadership was the key driver to millennial nurse work satisfaction”. Within the study conducted by Saber (2013, p.330), “praise and recognition, clinical competence, and accomplishments are found to be needed for satisfaction [for Millennial generation nurses]”. One of the studies conducted by Stevanin, Palese, Bressan, Vehviläinen-Julkunen, and Kvist (2018) states that Millennials have shown higher rates of satisfaction in the 12th month of the first year of working as compared to the 3rd month of the first year of working. This study also indicates “Baby Boomers reported lower levels of stress and burnout than did Generation X and Millennials, and different work engagement” (Stevanin et al., 2018, p.1245). An additional study conducted by Stevanin et al. (2020) points to “[Millennial nurses] perceiving themselves to be less attached to their jobs yet they are sensitive to motivation and emotional aspects of work; they also require more feedback and resources...”. Stover (2020) argues there is a “statistically significant

relationship between job satisfaction and work engagement among Millennial registered nurses.” Finally, Wieck, Dols, and Landrum (2010) conducted an online survey for nurses of all generations at 22 southern United States hospitals to take. The results of the study signal that “by increasing rates of job satisfaction and work engagement, retention rates will also increase.” (Wieck et al., 2010).

Search Results

An initial search of three databases yielded a total of 93 articles that had been narrowed by search limiters (51 from PubMed, 22 from CINAHL Complete, and 20 from Google Scholar). These 93 articles were then evaluated for duplicate articles between databases, which resulted in the removal of 18 articles. The outstanding 75 articles were then evaluated against inclusion and exclusion criteria. Of the 75 articles, 60 were discarded as they did not match the PICO constraints outlined in the stated foreground research question. At the conclusion, 15 articles remained, which were selected for review. Figure 1 is shown below which depicts the search strategy employed and PICO criteria utilized for this study.

Figure 1 Selection Process of Included Studies

Results

Characteristics of Identified Studies

Out of the 15 peer-reviewed articles utilized, there were a total of over 7,100 registered nurses included from the multigenerational nursing workforce. Many studies focused specifically on Millennial generation nurses; however, some highlighted the differences between how registered nurses in each generation view achieving job satisfaction or work engagement. Major findings include the fact that Millennial nurses are significantly less satisfied in their jobs compared with nurses of other generations (Waltz et al., 2020). Another study indicates that Millennials in the nursing workforce enjoy shared governance structures, providing mentorship, and support for data collection and analysis, which can improve rates of satisfaction and engagement in the workplace (Broom, 2010).

Measurement of Job Satisfaction in Millennial Nurses

In many of the articles reviewed, job satisfaction was a main factor that Millennial nurses sought while working, as compared to the nurses who identified as a part of previous generations, such as the Baby Boomers or Generation X. Broom, 2010, *Entice, engage, endure: adapting evidence-based retention strategies to a new generation of nurses*. Broom also identified that a flat, organizational structure, visionary and engaging leadership, participative management, and availability of adequate resources to support nursing care had a significant impact on nursing job satisfaction.

Measurement of Work Engagement in Millennial Nurses

Similarly, to job satisfaction, work engagement was a high priority for many Millennial nurses, as compared to Baby Boomers and Generation X. After reviewing extracted data, it was determined that involving Millennials in teamwork or drawing on their talents regarding technology can increase engagement (Broom, 2010). More specifically, Veteran-aged nurses were the most engaged, followed by Baby Boomer, Gen X and Millennial. The sample scored highest on dedication and lowest on vigor. Veterans and Baby Boomer nurses were statistically different than Gen X and Millennial nurses in their level of engagement. There were no statistical differences between Veteran and Baby Boomers and between Gen X and Millennials in their level of engagement. Generation X and Millennials scored lowest on level of engagement and are statistically similar in their level of disengagement (Hisel, 2020).

Major Findings

Discussion

Overview

The majority of the 15 articles reviewed determined that job satisfaction and work engagement were important factors in a Millennial generation nurse’s idea of how successful they were and how much they valued their job. Collectively, the 15 articles evaluated in this literature review indicate that involving Millennial nurses and allowing them to showcase their ability to be an active member of a team and have a voice in decision making, will increase job satisfaction and work engagement rates for many.

Major Findings Assessment

All included studies found that Millennial nurses are the generation that has the most issues finding job satisfaction and work engagement, as compared to older generations. Millennial nurses also might be more likely to use more assertive communication when speaking to nurses who identify as part of older generations, such as Baby Boomers or Generation Xers. This is a major difference between the youngest and older generations and might cause some friction in the workplace, however, it is good for Baby Boomers and Generation Xers to know that Millennial nurses value being involved and having an active role in the workplace. By allowing them to achieve those things, Millennial nurses report higher levels of job satisfaction and work engagement, as well as higher retention rates.

Limitations

There were variations between the 15 studies evaluated that should be inspected. The main discrepancy is regarding the fact that the Millennial generation spans from 1980 to 2000, which indicates a wide variety of ideas and preferences on how to identify job satisfaction and work engagement. Each study might find value in splitting the Millennial generation even further into smaller groups that represent a piece of the 20-year time span that this generation encompasses. Future research endeavors should focus on the separation of the Millennial generation into subgroups to better disseminate between Millennial viewpoints based on age, work specialty area, life experiences, and more. This way, specific data can be extracted and more personalized information can be used to improve job satisfaction and work engagement rates for the future.

Conclusions

The purpose of this literature review was to analyze if Millennial generation nurses were more likely to find job satisfaction and work engagement in the workplace than nurses who identified as members of older generations (Baby Boomers or Generation X). After reviewing the 15 total included studies, the extracted data is significant enough to warrant the conclusion that Millennial nurses are not more likely to find job satisfaction and work engagement than nurses of older generations. However, much of the data extracted from the included articles also indicated that there is peer-reviewed evidence available to combat this from happening and increase those rates from where they are currently. This means there is hope for the future that Millennial generation nurses will continue to join the nursing workforce and will be able to find job satisfaction and engagement through their work if they are actively involved in a team and are given the freedom to express their opinions. Millennials should also be able to work effectively alongside their Baby

Boomer and Generation X counterparts when they feel as if they are respected and are able to bring something to the table. In addition, there is data to support the idea that by increasing rates of job satisfaction and work engagement in Millennial nurses, retention rates will also be increased. Increased retention rates regarding Millennial generation nurses are beneficial for the nursing workforce, as there is the real threat of a nursing shortage and a stable group of nurses is necessary for the continuation of the nursing profession in the future.
