Abstract

Recent collections and additional records of Collembola from caves in Arkansas are reported. Based on these collections and review of the literature, 35 collembolan species are known from Arkansas caves. Included in this group are 10 troglobiotic, or cave-limited, species: \textit{Lethemurus missus}, \textit{Pygmarrhopalites buffaloensis}, \textit{Pygmarrhopalites clarus}, \textit{Pygmarrhopalites dubius}, \textit{Pygmarrhopalites youngsteadtii}, \textit{Pseudosinella dubia}, \textit{Pseudosinella testa}, \textit{Sinella barri}, \textit{Sinella cavernarum}, and \textit{Typhlogastrura fousheensis}. Three of these species, \textit{Ps. buffaloensis}, \textit{Py. youngsteadtii}, \textit{T. fousheensis}, are endemic to Arkansas, while \textit{Ps. dubia} is known only from the Ozark Plateaus Ecoregion. The remaining species are more widespread. \textit{Lethemurus missus}, \textit{Ps. georgia}, \textit{Ps. testa}, and \textit{S. cavernarum} are reported for the first time in Arkansas. On the basis of this information, revisions to the current rarity rankings for collembolan species classified as troglobionts are recommended.

Introduction

Perhaps the earliest collections of Collembola (springtails) from Arkansas caves were those collected by T.C. Barr in 1958. Those specimens contributed to the description of \textit{Pseudosinella dubia} and \textit{Pygmarrhopalites (as Arrhopalites) clarus}, while giving the first Arkansas cave records for \textit{Pseudosinella argentea} and \textit{Pygmarrhopalites (as Arrhopalites) pygmaeus} (Christiansen 1960a, Christiansen 1966). At that time, \textit{Ps. dubia} was known from a few caves in Washington County, while \textit{Py. clarus} was reported from caves in both Arkansas and Missouri. The species \textit{Ps. argentea} and \textit{Py. pygmaeus} were more widespread and included non-cave records from other states (Christiansen 1960a, Christiansen 1966). McDaniel and Smith (1976) reported the first Arkansas cave records for \textit{Sinella barri}, \textit{Folsomia candida}, and \textit{Neanura barbari}, and added new cave locations across several counties for \textit{Ps. argentea}, \textit{Py. clarus}, \textit{Ps. argentea}, and \textit{Py. pygmaeus}. Nearly twenty years after Barr’s collections, Peck and Peck (1982) revisited one location for \textit{Ps. dubia}, Devils Den Cave, and reconfirmed its presence there. Also from this cave, they reported \textit{Folsomia candida}, and the first Arkansas cave records for \textit{Deuteraphorura pseudofimetaria} (as \textit{Onychiurus pseudofimetarius}) and \textit{Tullbergia tullbergia iowensis}. The same year Dunivan et al. (1982) reported \textit{Sinella barri} from a cave in Randolph County, adding a second county to the Arkansas portion of its range (Christiansen 1960b).

More recently, Christiansen and Bellinger (1998) reported county occurrences in Boone, Clay, Newton, Randolph, Searcy, Stone, and Washington for cave populations of \textit{Ps. argentea}, and added a third county for \textit{S. barri}. Graening et al. (2006) summarized cave faunal inventories conducted within the Buffalo National River and reported collembolan records for \textit{Deuteraphorura pseudofimetaria} (as \textit{Onychiurus pseudofimetarius}), \textit{Folsomia novalis}, \textit{Hypogastrura antra}, \textit{Isotoma notabilis}, \textit{Pogonognathellus} (as \textit{Tomocerus} flavescens), \textit{Praisotoma ballistura antiqua}, \textit{Pseudosinella aera}, \textit{Ps. argentea}, \textit{Pseudosinella collina}, \textit{Pseudosinella folsomi}, \textit{Pseudosinella violenta}, \textit{Py. (as Arrhopalites) clarus}, \textit{Py. (as Arrhopalites) pygmaeus}, \textit{Ptenothrix ptenothrix marmorata}, \textit{Smithurides hyogramme}, and \textit{Tomocerina lamellifer} (as \textit{Tomocerus lamelliferus}). In the same year, the species, \textit{Typhlogastrura fousheensis}, was described from Foushee Cave, Independence County (Christiansen and Wang 2006). Finally, Zeppelini et al. (2009) described \textit{Pygmarrhopalites buffaloensis} and \textit{Pygmarrhopalites youngsteadtii} from individual caves in Newton County, added new cave records for \textit{Py. pygmaeus}, and reported the first Arkansas cave record for \textit{Pygmarrhopalites dubius}.

Over the past 6 years, a consortium of researchers, land managers, and agency personnel have conducted faunal inventories in Arkansas caves under an umbrella project called the Ozark Subterranean Biodiversity Project, and some of these inventories included collections of collembolans. The purpose of this study...
Recent Collections and Additional Records of Collembola from Arkansas Caves

is to report these new springtail records, summarize Arkansas distributions for those species known typically from caves (troglobionts), and revise current rarity rankings of these troglobionts for future use in conservation planning.

Materials and Methods

A review of the literature was conducted, and a request for information was sent to Kenneth Christiansen in 2003 for Arkansas cave records listed in a Collembola Database maintained at Grinnell College. These records are not included in the results because they are publically available online (http://web.grinnell.edu/courses/bio/collenbola/maintable_menu.asp). All troglobiotic (or cave limited) species records from the Collembola Database, literature records, and recent collections were used to update rarity rankings. Field collections were made from 2001 to 2006. Most often, specimens were hand collected during visual inspection of woody debris, animal feces, or other organic material. Occasionally, specimens were extracted from organic material using a Berlese funnel. Collections were identified by one of three collembolan taxonomists: Kenneth Christiansen (Grinnel College, Iowa), Joseph Reznik (University of Vermont, Vermont), or Jeffrey Batigelli (Earthwork Research Group, Alberta, Canada). An asterisk (*) by the species name indicates the species is a troglobiont. A “troglobiont” is a species that is only known from subterranean environments such as caves, and the use of this term is preferred instead of the word “troglobite” (Sket 2008).

Results

Twenty species of Collembola in 7 families were collected during field surveys, and these records are reported herein.

Family Arrhopalitidae Stach

Family Entomobryidae Schäffer

Pseudosinella violenta – Boone County: Big Hole Cave, 10-November-2001, M. Slay, M. Covington, C. Brickey; Marion County: Marble Falls Cave, 07-September-2001, G. Graening, M. Slay; Searcy

**Family Tomoceridae** Schäffer

**Family Pogonognathellidae** Schäffer

**Discussion**

A total of 35 collembolan species are known from Arkansas caves. *Pseudosinella georgia, Ps. testa, S. cavernarum,* and *L. missus* are reported for the first time in Arkansas. Of the total species, 10 are considered troglobionts and are listed in Table 1. The most common troglobiotic springtail in Arkansas is *Pseudosinella clarus* with populations occurring in 13 counties. *Pseudosinella dubia* is still known from just 4 caves in Washington County, Arkansas, but it was also identified by K. Christiansen from a cave in Dent County, Missouri from specimens collected by Gardner (1986). The rarest troglobions are the recently described *Pseudosinella buffaloensis,* *Pseudosinella youngsteadtii,* and *T. fousheensis;* each endemic to its type locality (Christiansen and Wang 2006, Zeppelini et al. 2009). Given the greater U.S. distributions for *S. barri,* *S. cavernarum,* and *L. missus,* future species inventory is likely to identify other Arkansas cave populations.

Based on our current understanding of the distribution of troglobiotic collembola in Arkansas, new rarity rankings are suggested for the national Natural Heritage Program. Existing rankings and recommended revisions are included in Table 1. Of continuing special concern are *T. fousheensis,* *Ps. testa,* and the recently described *Ps. buffaloensis* and *Pseudosinella youngsteadtii.* Conversely, *Pseudosinella clarus* is now known from enough Arkansas sites to warrant upgrading to a less imperiled status in the state.
Recent Collections and Additional Records of Collembola from Arkansas Caves

Table 1. Distribution of troglobiotic collembola reported from Arkansas caves and updated rarity rankings at the Global (G-rank) and Subnational/State (S-rank) levels. A rank of 1 indicates the species is critically imperiled and a rank of 5 indicates the species in demonstrably widespread and secure. The reader is referred to NatureServe (2009) for a complete explanation of the ranking system and access to the national database.
