GENERAL NOTES

The Desmids (Conjugatophyceae) from Arkansas

Jennifer A. Akin and Richard L. Meyer

Department of Biological Sciences
University of Arkansas at Fayetteville
Fayetteville, AR 72701

Introduction

Several algal records for the state of Arkansas have formerly been reported. These published works include the Cyanophyceae, Chrysophyceae, Bacillariophyceae, Chlorophyceae, Dinophyceae, Euglenophyceae (Hoffman and Causey, 1952), Conjugatophyceae, Xanthophyceae, Cryptophyceae, Rhodophyceae (Meyer, 1969; Meyer et al., 1970), the loricate Chrysophyceae (Meyer, 1971), and the scaled Chrysophyceae (Andersen and Meyer, 1977). A list of the Cyanophyceae also has been distributed by Meyer through the Arkansas Academy of Science flora and fauna series.

Through additional research previously unreported and new Conjugatophyceae taxa have been observed. These observations have been joined with those previously reported for a complete list of the known desmid flora of Arkansas. This paper presents a current inventory of the desmid flora (Conjugatophyceae) collected in the Ozark and Salem Plateaus and adjacent regions in Arkansas. Desmid taxa previously reported by Meyer (1969), Meyer et. al., (1970), and Hoffman and Causey (1952) are denoted by a (1), (2), and (3) respectively.

The majority of the newly reported desmids were collected within islands of vascular vegetation, as the metaphytic subcommunity, from diverse communities; ponds, pools, and lakes. This subcommunity is defined by Round (1965) as the algae which are in close association with vegetation but not stringently attached to the macrophytes or euplanktonic. Additional taxa from the euplanktonic or open water subcommunity are included. The classification of most of the *Actinotaenium* and *Staurodesmus* follows the nomenclature of Teiling (1954, 1948). All other taxa follow the nomenclature of Prescott et al., (1972, 1975, 1977, 1981a, 1981b, 1981c).

This paper lists a total of 191 species and 128 varieties formerly unreported for the state. Newly reported taxa of 10 Mesotaeniaceae and 237 Desmidiaceae are presented. Sixteen new combinations of *Staurodesmus* are established.

ACKNOWLEDGEMENTS.—The authors express great appreciation to the undergraduate and graduate students in phycology classes and laboratories for their many con-

tributions to this collection.
